

Question 1:

Count Pairs 'ag': Given a character array $ch[N]$ of size N , We have to calculate the number of pairs of indices i, j where $i < j$ && $ch[i] == 'a'$ && $ch[j] == 'g'$

Constraints

- $1 \leq N \leq 10^5$
- $'a' \leq ch[i] \leq 'z'$

Quiz 1

Quiz 2:
way 1:

(0, 2)

(5, 6)

4 pairs

(0, 4)

(0, 6)

way 2:

ch[] :

(0, 2)

(0, 4)

(0, 6)

4 pairs

(5, 6)

Brute Force

```
int pairs (char[] ch , int N){
```

```
    int count = 0;
```

```
    for (i = 0; i < N; i++) {
```

```
        for (j = i + 1; j < N; j++) {
```

```
            if (ch[i] == 'a' && ch[j] == 'g') {
```

```
                count++;
```

```
            }
```

```
        }
```

```
    }
    return count;
```

T.C: $O(N^2)$

S.C: $O(1)$

Brute force?

```
int pairs (char[] ch , int N){
    int count = 0;
    for (j = 0; j < N; j++) {
        if (ch[j] == 'g') {
            for (i = 0; i < j; i++) {
                if (ch[i] == 'a') {
                    count++;
                }
            }
        }
    }
    return count;
}
```

T.C:

Ex:

ch[] = d ↓ ↓ ↓ ↓ ↓ ↓
 b h i s b z d ⇒ N iter

ch[] = a ↓ a ↓ a ↓ a ↓ a
 a g a g a g a g a g

1 + 3 + 5 + ⇒ $O(N^2)$

Efficient

Approach 1:

ch =

b	c	a	g	g	a	a	g
0	1	2	3	4	5	6	7
↑	↑	↑	↑	↑	↑	↑	↑

count-a = 1

count-a = 3

count-a = 0 ≠ 3

ans = 1 + 1 + 3 = 5

```
int pairs (char[] ch, int N) {
```

```
    int count-a = 0;
```

```
    int ans = 0;
```

```
    for (i=0; i<N; i++) {
```

```
        if (ch[i] == 'a') {
```

```
            count-a++;
```

```
        }
```

```
        else if (ch[i] == 'g') {
```

```
            ans = ans + count-a;
```

```
        }
```

```
    }
```

```
    return ans;
```

```
}
```

T.C: $O(N)$

S.C: $O(1)$

Efficient Approach 2:

arr = a c b a g k a g g
 0 1 2 3 4 5 6 7 8

Iterate from right to left and carry forward the no. of g's to your right

T.C: $O(N)$
S.C: $O(1)$

Question 2: No. of leaders

Given an array $arr[N]$, you have to find a number of leaders in the array.

Leader: An element $arr[i]$ is said to be a leader if it is greater than the maximum element of all elements present on the left of it i.e $[0, i-1]$

Note:

$arr[0]$ is already considered a leader.

Constraints

- $1 \leq N \leq 10^5$
- $1 \leq arr[i] \leq 10^9$

Exo: A =

3	2	4	5	2	7	-1	15	Ans = 5
0	1	2	3	4	5	6	7	
✓	✗	↑	↑	↑	↑	↑	↑	

Exo: A =

4	2	3	9	7	10	Ans = 8
	↑	↑	↑	↑	↑	

Exo: A =

16	17	4	3	5	2
0	1	2	3	4	5
Ans = 2					

Brute Force

flag = True / False

count = 1

```
int leaders (int[] A , int N) {  
    count = 1;  
    for (i = 1; i < N; i++) {  
        bool flag = True;  
        for (j = 0; j < i; j++) {  
            if (A[j] > A[i]) {  
                flag = False;  
            }  
        }  
        if (flag == True) {  
            count++;  
        }  
    }  
    return count;  
}
```

T.C: $O(N^2)$
S.C: $O(1)$

Efficient Approach

A =

2	5	3	4	17	16
0	1	2	3	4	5

A =

2	5	3	4	17	16
0	1	2	3	4	5

count = ~~1~~ 3

max = ~~A[0]~~

8 17

```
int leaders (int[] A, int N) {  
    int count = 1;  
    int max = A[0];  
    for (i = 1; i < N; i++) {  
        if (A[i] > max) {  
            count++;  
            max = A[i];  
        }  
    }  
    return count;  
}
```

T.C: $O(N)$
S.C: $O(1)$

Question: Buy and Sell Stocks

Say you have an array, A, for which the i th element is the price of a given stock on day i .

If you were only permitted to complete at most one transaction (i.e., buy one and sell one share of the stock), design an algorithm to find the maximum profit.

Return the maximum possible profit.

$$0 \leq A.size() \leq 10^5$$

$$1 \leq A[i] \leq 10^9$$

$$N=8$$

A =

3	5	3	2	4	3	8	6
0	1	2	3	4	5	6	7

$$\text{Buy 0} - \text{sell 7} \Rightarrow 6 - 3 = 3$$

$$\text{Buy 2} - \text{sell 6} \Rightarrow 8 - 3 = 5$$

$$\text{Buy 3} - \text{sell 6} \Rightarrow 8 - 2 = 6$$

A :

0	1	2	3	4
1	4	5	2	4

$$\text{Buy 0} - \text{sell 2} \Rightarrow 5 - 1 = 4$$

A =

6	7	5	2	6	9	3
0	1	2	3	4	5	6

$$\text{Buy 3} - \text{sell 5} \Rightarrow 9 - 2 = 7$$

8:34

$\Rightarrow A =$

5	8	7	6	5	4
0	1	2	3	4	5

 $\Rightarrow 8 - 5 = 3$
 $\text{max} = 8$
 $\text{min} = 5$

$\Rightarrow A =$

1	2	3	4	5
0	1	2	3	4

 $\text{profit} = 5 - 1 = 4$

$A =$

9	8	7	6
0	1	2	3

 $\text{Profit} = 0$

$A =$

9	5	8	7	4
0	1	2	3	4

 $\text{max} = 9$
 $\text{min} = 4$
 $\text{Profit} = 5$

Brute Force

$A =$

4	2	3	8	5	9	7
0	1	2	3	4	5	6

```

int maxprofit = 0;
for (i = 0; i < N; i++) {
    // Buy on Day i
    for (j = i + 1; j < N; j++) {
        profit = A[j] - A[i];
        maxprofit = max(maxprofit, profit);
    }
}

```

return maxProfit;

T.C: $O(N^2)$

S.C: $O(1)$

Efficient Approach

A =

minLeft = A[0] = 4

maxProfit = 0

2 - 4 = -2

3 - 2 = 1

8 - 2 = 6

5 - 2 = 3

1 - 2 = -1

9 - 1 = 8

7 - 1 = 6

maxProfit = 0;

minLeft = A[0];

for (i = 1; i < N; i++) {

// Sell on day i

profit = A[i] - minLeft;

// Sell on day i

maxProfit = Math.max(maxProfit, profit);

if (A[i] < minLeft) {

minLeft = A[i];

}

}

return maxProfit;

$$[A[i]] > \minLeft[i]$$

$$2 \quad 3 \quad 4 \quad \{ \textcircled{5} \}$$

minLeft = 2

Way 2:

$$\text{maxRight} = 9$$

$$\text{max-profit} = 9 - 7 = 2$$

$$\text{profit} = 7 - 9 = -2$$

$$9 - 5 = 4$$

$$9 - 8 = 1$$

$$9 - 3 = 6$$

$$9 - 2 = 7$$

$$9 - 4 = 5$$
